HydroV® | Seized Valve Release System

- Over 4,000 Valves Successfully Released
 - Safe for Operators
 - Avoids Valve Replacement
 - Kind to Your Assets
 - Utility in the Field

Over 4,000 Valves Successfully Released

All valve types can seize, no matter their age or size. Be it an emergency release, or part of planned maintenance, HydroV® technology can release your seized valve.

Kind to Your Assets

HydroV® identifies and applies only the minimum torque required to free your valve, reducing the risk of valve shaft failure or unwanted damage. Both frequency and amplitude can be adjusted independently, and the system is fully calibrated to ensure no uncertainty.

Safe for Operators

The safest solution on the market for both your assets and operators; Manpower is not needed to create torque or impact. HydroV® is pneumatic and operated remotely.

Avoids Valve Replacement

When you can safely and successfully release a valve, there is no need to dedicate the time and money necessary to replace them, which in-turn allows funds to be allocated to other distribution system maintenance and repairs.

Utility in the Field

HydroV's smart, modular design enables it to be used in some of the most remote and awkward to access locations. As a modular system, HydroV® can grip to any valve in any orientation and enables risk free operation and flexibility.
